The Evolution and Importance of Hydrogen Research in the Czech Republic

Although hydrogen technologies present a forward-looking approach to decarbonization and future energy security, substantial scientific and technical challenges must be addressed in order to achieve their widespread adoption. The hydrogen economy spans four functional areas: production, storage, transportation and use; each area has its special set of grand technical challenges. Recent advances in materials science, chemistry, physics, biology, computation, and nanoscience provide considerable promise for breaking through many of these current barriers. These advances underpin our vision and provide confidence that the widespread use of hydrogen outside current uses is achievable. The aim of the *Catalogue of Hydrogen Research in the Czech Republic* is to facilitate the networking of Czech and foreign researchers and to facilitate the search for the right partners in various areas of hydrogen research, development and innovation.

Hydrogen research in Czechia has a long and fascinating history, marked by both early innovation and modern advancements. This journey underscores the country's commitment to sustainable energy solutions and highlights its growing role in the global hydrogen economy.

Early Beginnings

Hydrogen research in Czechia can be traced back to the mid-20th century, when the Czechoslovak engineering company ČKD (Českomoravská-Kolben-Daněk) Semiconductor Division realized 1 kW alkaline fuel cells for locomotive propulsion. These efforts showcased remarkable ambition but faced significant challenges. In the 1970s, progress stalled due to political and economic factors. Despite this pause, the early 2000s marked a revival of hydrogen research in Czechia, aligning with global efforts to reduce reliance on fossil fuels and transition to sustainable energy sources.

The Importance of Hydrogen Research in Czechia

Today, Czechia is home to a robust ecosystem of academic, industrial, and governmental stakeholders actively advancing hydrogen technologies. This ecosystem is characterized by cutting-edge research, international collaborations, and practical applications.

Hydrogen holds immense potential as a versatile energy carrier. Its applications span across industries, from decarbonizing transport and industry to enabling long-term energy storage and reducing greenhouse gas emissions. Hydrogen research is essential not only for environmental sustainability but also for energy security and economic competitiveness. As the world transitions to a low-carbon economy, countries that invest in hydrogen technologies are likely to benefit from new markets, jobs, and technological leadership.

One of the advantages of Czech hydrogen research is deep knowledge in industrial processes connected with hydrogen as industrial chemistry, machining, gas transportation and storage, nuclear research etc. This background allows Czech research institutions to implement unique knowledge into newly developed products and processes. As example heavy truck Tatra for extreme conditions can be mentioned.

For Czechia, hydrogen offers a pathway to reduce dependency on imported fossil fuels, enhance the resilience of its energy systems, and meet ambitious climate goals. By integrating hydrogen into its governmental strategies, Czechia can position itself as a hub for innovation and a model for other countries aiming to decarbonize their economies.

The Role of International Cooperation

International cooperation is a cornerstone of hydrogen research and development. Collaborative projects like RegioHyt and NEXTAEC illustrate the value of pooling expertise, resources, and funding to achieve breakthroughs that no single country could accomplish alone. Czechia's partnerships with leading institutions in countries such as Norway, Germany, Denmark, and South Korea demonstrate its active role in the global hydrogen community.

These collaborations accelerate the development of advanced technologies, such as efficient electrolyzers and hydrogen storage systems, while fostering knowledge exchange and capacity building. Moreover, international projects confirm Czechia as a credible partner in the global hydrogen economy, attracting investments and creating opportunities for local businesses and researchers.

Czech Hydrogen Technology Platform – your contact point

The Czech Hydrogen Technology Platform (HYTEP) aims to connect research and development with business partners, foster mutual awareness among entities involved in hydrogen technologies, and undertake initiatives to enhance the potential of hydrogen applications in the Czech Republic, aligning with the climate goals of the European Union and its Member States.

HYTEP is a main national contact point helping you to find a suitable partners for planned research and development.

	We are an R&D center with extensive technical expertise, dedicated to delivering comprehensive solutions to complex material and technological challenges. Our cutting-edge facilities include, as an example, advanced 3D printers, melting furnaces, and universal mechanical testing machines for both static and dynamic tests, supported by Digital Image Correlation (DIC).
	In the field of hydrogen technologies, we focus on the development of innovative materials with enhanced properties, such as improved strength and resistance to hydrogen embrittlement. Additionally, we conduct specialized tests to detect hydrogen embrittlement, including experiments in electrolytes and under pressurized hydrogen conditions.
	We actively drive innovation in industries such as automotive, aerospace, and energy, empowering our partners to achieve outstanding results through advanced research and development.

	 2 Czech patents granted on new fuel cell system control software developed by NTC-UWB research team
	Grant schemes
	 Grant schemes FW03010323 Enhancement of Hydrogen Storage Properties of AlTiVCr Light Weight High Entropy Alloys (HEA) by Ti3C2 Mxene and Several Plastic Deformation (EHSAL). <i>EIG Concert Japan Call</i> 2021 (project coordinator). 2022–2025
	 FW03010323 Enhancement of Hydrogen Storage Properties of AlTiVCr Light Weight High Entropy Alloys (HEA) by Ti3C2 Mxene and Several Plastic Deformation (EHSAL). <i>ElG Concert Japan Call</i>
	 FW03010323 Enhancement of Hydrogen Storage Properties of AlTiVCr Light Weight High Entropy Alloys (HEA) by Ti3C2 Mxene and Several Plastic Deformation (EHSAL). <i>EIG Concert Japan Call</i> 2021 (project coordinator). 2022–2025 TH82020002 Development and processing of advanced metal hydride composites with specific micro- structure properties for mobile hydrogen storage applications, <i>M-EraNet call</i> 2022 (project coordinator).
	 FW03010323 Enhancement of Hydrogen Storage Properties of AlTiVCr Light Weight High Entropy Alloys (HEA) by Ti3C2 Mxene and Several Plastic Deformation (EHSAL). <i>EIG Concert Japan Call</i> 2021 (project coordinator). 2022–2025 TH82020002 Development and processing of advanced metal hydride composites with specific micro- structure properties for mobile hydrogen storage applications, <i>M-EraNet call</i> 2022 (project coordinator). 2023–2026 TH83020002, Identification of the effect of hydrogen as a function of structural condition in pipeline
	 FW03010323 Enhancement of Hydrogen Storage Properties of AlTiVCr Light Weight High Entropy Alloys (HEA) by Ti3C2 Mxene and Several Plastic Deformation (EHSAL). <i>ElG Concert Japan Call</i> 2021 (project coordinator). 2022–2025 TH82020002 Development and processing of advanced metal hydride composites with specific micro- structure properties for mobile hydrogen storage applications, <i>M-EraNet call 2022</i> (project coordinator). 2023–2026 TH83020002, Identification of the effect of hydrogen as a function of structural condition in pipeline distribution infrastructure and storage tanks, <i>CET Partnership Call</i> 2022. 2023–2026 TQ06000001 Clad pipes for safe and effective hydrogen transport and storage (CladPipe4H2),
	 FW03010323 Enhancement of Hydrogen Storage Properties of AlTiVCr Light Weight High Entropy Alloys (HEA) by Ti3C2 Mxene and Several Plastic Deformation (EHSAL). <i>ElG Concert Japan Call</i> 2021 (project coordinator). 2022–2025 TH82020002 Development and processing of advanced metal hydride composites with specific micro- structure properties for mobile hydrogen storage applications, <i>M-EraNet call</i> 2022 (project coordinator). 2023–2026 TH83020002, Identification of the effect of hydrogen as a function of structural condition in pipeline distribution infrastructure and storage tanks, <i>CET Partnership Call</i> 2022. 2023–2026 TQ06000001 Clad pipes for safe and effective hydrogen transport and storage (CladPipe4H2), <i>CET Partnership Call</i> 2023. 2024-2027 TM05000013 – Advanced Graphene Electrode Architecture for Proton Exchange Membrane Fuel Cell,
	 FW03010323 Enhancement of Hydrogen Storage Properties of AlTiVCr Light Weight High Entropy Alloys (HEA) by Ti3C2 Mxene and Several Plastic Deformation (EHSAL). <i>ElG Concert Japan Call</i> 2021 (project coordinator). 2022–2025 TH82020002 Development and processing of advanced metal hydride composites with specific micro- structure properties for mobile hydrogen storage applications, <i>M-EraNet call</i> 2022 (project coordinator). 2023–2026 TH83020002, Identification of the effect of hydrogen as a function of structural condition in pipeline distribution infrastructure and storage tanks, <i>CET Partnership Call</i> 2022. 2023–2026 TQ06000001 Clad pipes for safe and effective hydrogen transport and storage (CladPipe4H2), <i>CET Partnership Call</i> 2023. 2024-2027 TM05000013 – Advanced Graphene Electrode Architecture for Proton Exchange Membrane Fuel Cell, <i>Technology Agency of Czech Republic (TA CR)</i> – 2023–2025 Discerning Study of ammonia Oxidation Reaction on Atomically Modified Electrocatalytic Materials,

	Hydrogen service provision
	Safety
	Codes and standards
••••••	Others including cross-cutting research directions
	We are a research and development centre with a broad technical background. We focus on solving the whole hydrogen problem. We cooperate with a number of other internal departments and external organisations.
	Your most important hydrogen research, development and innovation results including research grants in the last five years

Patents
Accredited method: Determination of H2 purity; Sampling of H2 to determine its purity, 2024
Grant schemes
TN02000007: NAHYC-m, National Hydrogen Mobility Center
 TK02010187: Research on the potential of hydrogen technologies for transformation of energy mix of Moravian-silesian region (MSK), low-carbon energy and development of low-emission mobility
• TK05020042: Development of a plasma torch for thermochemical conversion of input materials into a gas with a high hydrogen concentration
 CK04000248 – ESO: ESO – Vehicle of category N1 powered by hydrogen cells
SP2020/111: Hydrogen fuel conversion processes and hydrogen technology safety research
 TK03030198: Research and development processes of coke oven gas conversion to hydrogen and alternative fuel
MV-107265/OBVV-2022: Safety Concept of Hydrogen Technologies for Smart Cities and Regions
TK05010075: Complex hydrogen safety and security in the Moravian-Silesian Region
TQ06000002: Cost and resource efficient hydrogen storage at ambient temperature and maximum pressure of 3.5 MPa
TS01030175: Sustainable Catalytic Synthesis of Atmospheric Carbon and Green Hydrogen to Light Alcohols
